

# Talk to Your Doctor About AlloSure

## What is AlloSure?

AlloSure is a blood test that helps your nephrologist monitor the health of your new kidney

AlloSure measures a biomarker in your blood called donor-derived cell-free DNA (dd-cfDNA)

Levels may increase a median of 3 months before a leading sign of kidney issues is detected<sup>1</sup>

Adding AlloSure to your standard lab tests has been shown to detect rejection earlier<sup>2</sup>

## Notes:
